DISPLAY PACKAGE**TECHNICAL FIELD**

5

The present invention relates to a display and distribution packaging unit for articles, especially such fragile articles as eggs of the kind set forth in the preamble of claim 1.

10

DESCRIPTION OF PRIOR ART

Packages for packing and transporting fragile articles such as eggs are known in a variety of forms. Traditionally, such packages have comprised a bottom part provided with suitably shaped compartments for accommodation of the particular article, for instance eggs, and an upper part forming a cover over the bottom part for accommodating the upper portions of the articles housed within the package and for closing the package. Often, the upper part is connected to the lower part by means of a suitable hinge portion, although packages comprising separate bottom and upper parts have also been used. In those packages that comprise a hingedly connected bottom and cover part the vertical front side of the bottom part is often provided with a flexible flap comprising a number of protrusions for engagement with correspondingly located and shaped holes in the cover part, thereby locking the bottom and cover parts together in the closed state of the package. A package of this kind suffers from various disadvantages. In the closed position, the front face of the package will be subdivided into an upper part and a lower part and as the lower part is typically formed to be able to accommodate and support the articles contained within the package, it is only the upper part which can be given a planar shape that permits the application of text and pictures describing the contents of the package. In use in a store, such packages will often be stacked in a sales rack, and hence it is only the vertical front side which is visible to the customer. Furthermore, the presence of said holes in the cover part also reduces the possibility to use this face for written and pictorial information. It has furthermore been found that the opening of such packages is often troublesome, as it requires the user to press said protrusions into the holes to disengage the protrusions and the corresponding holes

from each other. This is especially problematic when two such packages are connected to each other in a side by side arrangement, as the user then has to push back two flaps simultaneously for opening and closing such packages.

- 5 A package for eggs of the type comprising a hingedly connected bottom and cover part is disclosed in VVO 00/03936. In order to solve the problem of providing a sufficiently large planar front face for the application of graphical material the front surface of the cover part extends completely down to the lowermost portion of the bottom part, so that it can rest on the surface supporting the package. Hence, a
- 10 large unbroken front surface is provided and the extension of the front surface to the supporting surface furthermore adds stability to the package and is beneficial during the moulding process of the package.

- 15 Apart from providing large unbroken surfaces for the application of various graphical descriptions of the content of the package, the information about the content of the package can also as an alternative or supplementarily be conveyed by the shape of the package or various parts hereof. A package of this type is the subject of EP 0 698565, which discloses a package comprising a separate packaging unit embracing the articles in an accommodating and supporting manner and where the
- 20 outer shape of the packaging unit reflects the shape of the eggs contained within the unit. This package is typically provided with a number, for instance six, of egg-shaped compartments and the package is furthermore provided with a display panel comprising suitably sized openings corresponding to the pattern of compartments of the packaging unit, such that the display panel can be placed on top of the
- 25 compartments in such a manner that the compartments can protrude at least partly through said openings

DISCLOSURE OF THE INVENTION

30

It is the object of the present invention to provide a package unit for articles, specifically articles of similar shape and size and more particularly eggs, which package unit at least partly reflects the shape of the articles contained within the unit and at the same time offers good opportunities for providing graphical information on

35 sufficiently large outer surfaces of the unit.

It is a further object of the present invention to provide a packaging unit which is more easy to open and close compared to traditional packages of the type described initially comprising a hingedly connected bottom and cover part.

5

It is a further object of the invention to provide a packaging unit which is at least partly of a mechanically strong shell structure that protects the article contained herein, supports these articles over a large surface of these and generally adds mechanical stability to the package.

10

These and other objects and advantages are attained with a packaging unit according to the characterising portion of claim 1. Various advantageous embodiments are defined in the dependent claims.

15

The packaging unit according to the present invention thus comprises a bottom part provided with one or more compartments for accommodating and supporting the articles and a cover part, where one or more portions of the cover part are shaped such that they reflect the shape of the article(s) contained within the packaging unit, thereby making the shape of the articles contained within the unit visible from

20

outside.

According to one embodiment of the invention, said bottom and cover parts are hingedly connected to each other along one edge hereof, the opposite upper edge of the bottom part in this embodiment being provided with a flexible flap comprising at least one outwardly extending protrusion for engagement with a corresponding opening in the cover part.

25

According to a preferred embodiment of the invention, said protrusions and corresponding openings are shaped to form a tight engagement between the protrusion and the corresponding opening around the entire circumference of the protrusion, but shape of openings and corresponding protrusions only providing engagement over a portion of the circumference of the protrusion may also be used.

30

According to a further embodiment of the invention, the display and distribution packaging unit is characterised in that said cover part on the portion hereof, which is

35

formed to reflect the shape of the articles in the package, has a different surface structure from remaining portions of the cover part. For instance the portion reflecting the shape of the articles may have a relatively coarse surface texture, whereas those portions upon which graphical information is to be provided, for instance using adhesive labels, could have a more smooth texture.

According to a further embodiment of the invention, the display and distribution packaging unit is characterised in that the interface between said cover part and said bottom part inclines downwardly from the rear side of the package to the front side, thus yielding a higher front side than rear side, the higher front side thereby providing more space for the attachment of labels, etc.

BRIEF DESCRIPTION OF THE DRAWINGS

15

The invention will now be described in more detail with reference to the accompanying drawings, in which

Figure 1 is a schematic perspective view of one embodiment of a packaging unit according to the invention;

Figure 2 is a top and bottom view of the above embodiment of a packaging unit according to the invention;

Figures 3a to 3e show various embodiments of the packaging unit according to the invention; and

Figure 4 shows a detail of an embodiment of the invention.

DETAILED DESCRIPTION OF THE INVENTION

In the following, a detailed description of one embodiment of the invention is given.

With reference to Figure 1 there is shown a display and distribution packaging unit according to the invention generally designated by 1 formed to accommodate six eggs. The unit comprises a bottom part 2 and a cover part 3 connected to each other along one edge by means of a flexible connection 12, in the following

generally referred to as a hinge. A portion of the cover part 3 reflects the shape of the eggs contained within the unit. The complete unit can be formed as one integrated unit by moulding.

5 The bottom part shown in Figure 1 is subdivided into six compartments 4 by appropriately shaping the wall sections of the bottom part and by inclusion of a pair of upwardly extending pillar posts 5 along the centre line of the bottom part. The shape of the side wall forming part of the compartments 4 may correspond to the shape of the eggs contained in the compartments, thereby providing a good support
10 for the eggs and visual information about the content of the packaging unit.

Placed along one upper edge portion of the bottom part 2, there is provided a flexible flap 6 on the outer surface of which there is provided an outwardly extending protrusion 7. In the embodiment shown in Figure 1, only one protrusion 7 is present
15 but it is understood that more than one protrusion could be provided if desirable.

According to one embodiment of the invention portions of the flap 6 may be formed in such a manner that they constitute a part of the walls of the adjacent compartments of the unit. This embodiment is shown in detail in Figure 4.
20

The cover part 3 according to the embodiment shown in Figure 1 comprises essentially two different portions, i.e. a central portion comprising the substantially planar top face 10 and the substantially planar front and rear faces 14, 15. The front face is provided with an aperture 9, the position of which corresponds to the
25 protrusion 7 on the flexible flap 6 of the bottom part 2. The front face 14 being flexible it is possible to close the cover part 3, whereby the protrusion 7 will be brought into engagement with the aperture 9. Pulling along the edge portion of the front face 14 it is possible to bring the protrusion 7 out of engagement with the aperture 9, whereupon the packaging unit can be opened.
30

The combination of the downwardly curved shape of the front face 14 - as indicated by 17 in the figures - and the relatively large protrusions makes it easy for the user to open the unit. Furthermore, the protrusions are styled to suggest the contents of the unit, i.e. they are approximately egg-shaped.
35

The second portion of the cover part 3 comprises the egg-shaped compartment walls 8 located at either longitudinal end of the cover part 3. These compartment walls 8 provide additional support for the eggs contained within these compartments and reflects the shape of the eggs thereby providing a visual indication of the content of the packaging unit. To highlight the visual information – and provide a pleasing aesthetic effect – it is possible to provide the compartment walls 8 with a different surface texture than the planar surfaces 10, 14 and 15, which surfaces for instance can be used for the placement of labels etc.

Referring now to Figure 2, there is shown a top and bottom view of the packaging unit according to this embodiment of the invention. The egg-shaped compartment walls 8 are clearly visible on the top view. On the bottom view, the outer surface of the compartments 4 is shown together with a pattern of supporting ribs 11 formed between the bottom portions of the compartments 4. Both the curved wall portions 8 of the compartments 4 and the pattern of supporting ribs 11 provide increased mechanical stability of the packaging unit.

Referring to Figures 3a through 3e, there is shown various embodiments of the packaging unit according to the invention. Specifically, Figure 3a shows a packaging unit of the same basic form as shown in Figure 1 comprising 6 compartments 4 for eggs. Figure 3b shows an embodiment comprising three rows each containing three compartments 4, Figure 3c shows a unit comprising two rows of five compartments 4 and Figure 3d shows a unit comprising three rows of five compartments 4. In Figure 3e, there is finally shown a side elevation view of the packaging unit shown in Figure 3c. As indicated by reference number 16, the front face 14 of the cover part 3 can also be subdivided into two portions 14' and 14'' if desired, each of these portions 14', 14'' being provided with openings 9 for similarly placed protrusions 7 on the bottom part 2 of the unit. It is understood that instead of using two openings and corresponding protrusions as shown in Figures 3d through 3e, it is also possible to use other numbers of openings and protrusions, as for instance only one as shown in Figures 1 through 3b).

Although various embodiments of the present invention have been shown and described in the preceding parts of the detailed description, it is understood that a person skilled in the art may conceive other embodiments of the invention without

7

departing from the scope of the invention as defined by the following claims. Specifically, it is understood that any embodiment comprising any number of rows of compartments and an / number of compartments per row falls within the invention as defined by the claims.

5

CLAIMS:

1. A display and distribution packaging unit for articles, especially such articles as eggs, comprising:
- 5 - a bottom part (2) defining non-planar side surfaces so as to match at least partially the outer contours of the product or products to be packed;
- a cover part (3) defining at least a top surface (10) and substantially planar front- and rear surfaces (14, 15);
- 10 characterised in that said cover part (3) at least partially is formed to reflect the shape of the articles contained within said package.
2. A display and distribution packaging unit according to claim 1, characterised in that said cover part (3) on those portions (8) hereof which are formed to reflect the articles in the packaging unit has a different surface structure from remaining portions of the cover part.
- 15 3. A display and distribution packaging unit according to claim 1 or 2, characterised in that said portions (8) of the cover part (3) reflecting the shape of the articles in the packaging unit are located at one longitudinal end or both longitudinal ends of the cover part (3).
- 20 4. A display and distribution packaging unit according to claim 1, 2 or 3, characterised in that said cover part (3) on the planar front side (14) hereof is provided with at least one opening (9) for engagement with one or more protrusions (7) provided on said bottom part (2).
- 25 5. A display and distribution packaging unit according to claim 4, characterised in that said engagement between the one or more protrusions (7) and corresponding openings (9) is a tight engagement around the complete circumference of the protrusion (7).
- 30 6. A display and distribution packaging unit according to any preceding claim, characterised in that said bottom part (2) and said cover part (3) are
- 35

connected to each other by means of a hinge portion (12) extending along one edge portion of the interface between said bottom and cover parts (2, 3).

- 5 7. A display and distribution packaging unit according to any preceding claim, characterised in that the interface between said cover part (3) and said bottom part (2) inclines downwardly from the rear side of the package unit to the front side hereof, thus yielding a higher front side (14) of the cover part (3) than rear side (15) of the cover part.
- 10 8. A display and distribution package according to any preceding claim, characterised in that said bottom part (2) on the lower side hereof is provided with a pattern of supporting ribs (11), whereby the mechanical strength is increased.
- 15 9. A display and distribution package according to any preceding claim, characterised in that said one or more protrusions (7) are provided on a flexible flap (6) placed along one upper edge portion of the bottom part (2).
- 20 10. A display and distribution package according to claim 9, characterised in that portions of said flexible flap (6) are formed such that they constitute a part of the walls of adjacent compartments (4).

10

DISPLAY PACKAGEABSTRACT OF THE INVENTION

5

The invention relates to a display and distribution packaging unit for fragile articles, especially for eggs, comprising a bottom part (2) which at least partially matches the outer contours of the articles housed within the unit and a cover part (3) comprising planar top- and side surfaces (10, 14, 15) for the provision of graphical information about the contents of the unit, where portions of the cover part (8) are furthermore shaped to reflect the shape of the articles housed within the display and distribution package. The structure of the bottom and cover parts furthermore adds mechanical strength to the unit.
